

ABSTRACT OF THE INVENTION

2 A tool mounted to the end of a golf club or other handle serves as means for
3 retrieving a golf ball, for repairing a golf ball or club mark on the playing surface and for
4 preventing the club grip from contacting the ground when the club is laid horizontally. The
5 tool comprises a head detachably connected to the grip end of a golf club. In a preferred
6 embodiment, the head includes a tang which fits into a slotted plug in the end of the club
7 shaft under the grip. In an alternate embodiment, the head includes a yoke that cups over the
8 outer radius of the golf club grip and is held in place by an external strap. The head has three
9 flat surfaces serving as a shelf for lifting the golf ball and two walls forming a corner for the
10 ball to rest against and for keeping the ball captive during the retrieval process. Two prongs
11 protrude from the shelf for repairing ball marks. These two prongs or the body of the tool
12 also serve to hold the grip off the ground when the club is laid horizontally.
